WELCOME TO BUILDING ENCLOSURE COMMISSIONING

ONLINE TRAINING

KRISHNAJI PAWAR - CEO & FOUNDER

The background of the slide is a blurred office scene. It shows the heads and shoulders of several people, likely in a meeting. In the bottom left, there's a desk with some electronic equipment and cables. A large window in the background provides a view of a city skyline with various buildings.

Summary

- Every building is different, but performance testing in normal project specifications usually addresses the building enclosure the same way. Similarly, not every project has a specified commissioning strategy. Commissioning, like building enclosure design and construction, is dynamic and complicated, responding to the owner's project requirements (OPR), design, function, and occupant needs. The procedure must be flexible.
- Design and construction define building enclosure commissioning. Construction verifies design. By creating a thorough schedule of tests and evaluations, the building phase of a commissioning plan must account for the particular characteristics of each design feature. The goal is to verify the building enclosure meets the OPR and works as a whole and separately.
- This course briefly covers building commissioning from project initiation to occupancy. Examining commissioning plan design approaches. Building enclosure commissioning plan construction is explored using case studies. In addition to the lessons learned from the commissioning of these case study buildings, the case studies focus on the parameters for defining the testing kind, extent, and methodology utilised to conduct the schedule of tests.
