BEYOND SMART CITIES & THE
INTERNET OF THINGS (IOT)
TECHNOLOGY

LEARN.BEYONDSMARTCITIES.IN

The background of the slide is a photograph of a person with long brown hair, seen from behind, sitting at a desk. On the desk, there is a blue calculator, some papers, and a glass of water. In the background, there is a large window with a view of a city skyline. The overall lighting is soft and blue-toned.

Conclusion

- The technology behind the Internet of Things has a variety of uses, including reducing congestion and pollution in the environment, enhancing surveillance and automated parking systems, monitoring the weather and water supplies, and many more applications.
- The technology behind the Internet of Things (IOT) continues to advance and can be utilised on three different levels, namely the physical level, the intermediate level, and the upper level.
- Data sets make up the physical level; statistical measurements, such as correlation chi-square, probability calculation, and graphical analysis make up the intermediate level; and future planning, which is generated from the collected data, makes up the upper level.
- My brief introduction course is mostly based on the higher level, and it claims that the data gathered and computed by IOT technology has the potential to inspire new ideas and contribute to the advancement of human prosperity.
- The Internet of Things (IoT) technology enhances human capital and contributes to the creation of a sustainable future by combining the formerly separate but interrelated disciplines of technology, natural resources, and urban system development.

SMART CITY QUOTE

"Cities basically go out and want to do everything. Free Wi-Fi, meter reading, environmental sensors, information screens, they want them all and they want them for free. Key is to begin by developing a road map of desired services and then prioritize them."

Tormod Larsen
