GRIHA CERTIFIED PROFESSIONAL OVERVIEW

Green building involves environmentally responsible and resource-efficient construction, operation, maintenance, renovation, and deconstruction processes, enhancing traditional design considerations of cost-effectiveness, functionality, durability, and comfort.

Learning Objectives

- Introduction
- How green buildings fight climate change
- Sustainable Development and Green Buildings
- Organizational Fundamentals
- Green Rating for Integrated Habitat Assessment - GRIHA
- Advantages of GRIHA Certification
- Getting a GRIHA Certified Professional Credential
- Summary and Resources
- GRIHA CP Quiz_Test Your Knowledge!

BEYOND SMART CITIES

INTRODUCTION

- Sustainability is defined as maintaining conditions for productive harmony between humans and nature.
- GRIHA Green strategies and technologies should consider sustainable design and green building concepts.
- Green building is a process that applies to buildings, their sites, interiors, operations, and communities.
- Green building strategies aim to reduce environmental impact and improve the conditions for the planet and interior environments for building occupants.
- It's a holistic approach to finding responsible solutions within the build environment.

GREEN BUILDING EFFICIENCY SITE SELECTION

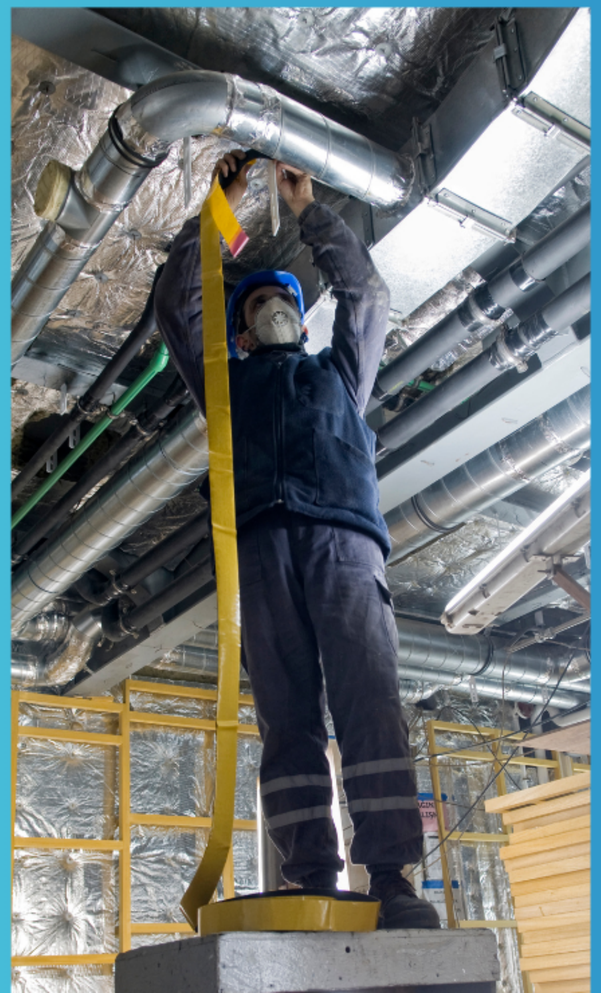

BEYOND SMART CITIES

- Consider urban redevelopment or support for urban sprawl.
- Determine proximity to public transportation and natural breezes for ventilation and daylight.

DESIGN OF BUILDING SYSTEMS

- Evaluate the interdependence of mechanical equipment, building envelope, and lighting systems.
- Account for heat emitted from lighting fixtures and gaps in the envelope for conditioned air escape.

BEYOND SMART CITIES

CONSTRUCTION PROCESSES

- Evaluate exposure to harmful fumes and gases during construction.
- Take precautions to reduce mold growth or other contaminants

OPERATIONS OF THE BUILDING

- What kind of items are purchased to support business?
- What about cleaning procedures?

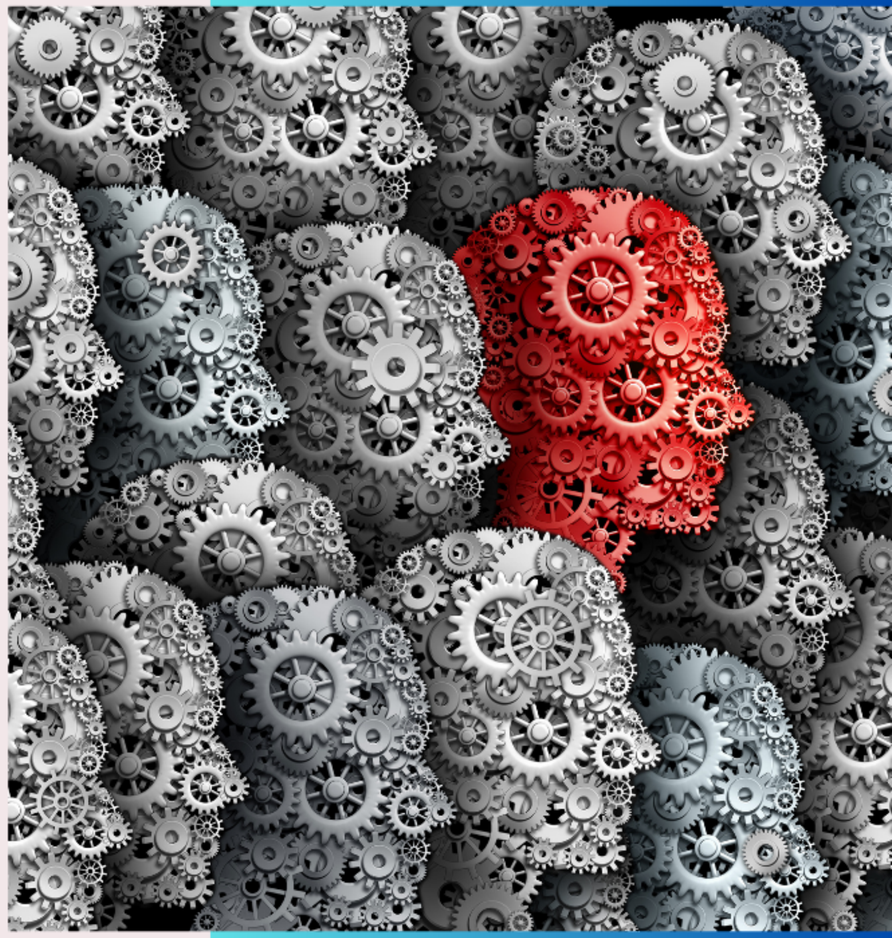

BEYOND SMART CITIES

Maintenance

• Regularly test equipment and monitor for leaks.

Waste Management

• Address construction waste and garbage generated during operations.

GREEN BUILDING BENEFITS

BEYOND SMART CITIES

- Economic: 30%-50% energy and water savings, reducing carbon footprint.
- Maintenance cost reductions: Improved system integration and performance.
- Value: Increased net operating income and better public relations.
- Tax benefits: Specific green building investments offer tax benefits.
- Productivity improvements: 3%-55% productivity improvement.
- Health benefits: Reduced absenteeism.

GREEN BUILDING BENEFITS +

- Risk management: Faster lease-up and sales, lower exposure to odors.
- Marketing and public relations: Easier recruitment and retention of key employees.
- Fund-raising incentives: Funding incentives for colleges and nonprofits.
- Demonstration of commitment to sustainability and environmental stewardship.

BEYOND SMART CITIES

TRIPLE BOTTOM LINE IN GREEN BUILDINGS

BEYOND SMART CITIES

- Green buildings' values are categorized into environmental, economic, and health and community aspects.
- Conventional projects typically focus on economic prosperity.
- For GRIHA Green certification projects, goals are evaluated against triple bottom line values.
- For instance, a green roof installation would compare financial implications to environmental impacts and community benefits.

SYSTEMS THINKING

- Similar to integrated project design, focuses on viewing each project part in relation to others.
- Nested systems can represent building projects, communities, or cities.
- Aims to avoid designing solutions that result in problems in other systems.
- Systems can develop emergent properties, like 4+4=9.

BEYOND
SMART CITIES

LIFE-CYCLE APPROACH IN GREEN BUILDING PROJECTS

- Encourages questioning all phases of a project, including material, product, and service.
- Starts before site selection and continues through design, construction, operations, refurbishment, and renovation.
- Aims for a building's life cycle to avoid demolition and adaptation and reuse.
- Uses systems thinking and closing the system to evaluate environmental impacts.
- Chooses between life-cycle assessment (LCA) and life-cycle cost (LCC) methodologies.
- LCA includes purchase price, fuel, installation, operation, maintenance, disposal, finance charges, and replacement costs.

DO GREEN BUILDINGS COST MORE??????.....

BEYOND SMART CITIES

TYPES OF COSTS IN GREEN BUILDINGS

- Hard costs are fees for professional services, legal and design fees, and pre- and postconstruction-related expenses.
- USGBC/IGBC/TERI promotes studies indicating that green buildings do not necessarily cost more.
- Certification as a green building is not a significant indicator of construction cost.

BEYOND SMART CITIES

BRIDGING THE GAP BETWEEN CAPITAL AND OPERATING BUDGETS

- It's important to bridge the gap between capital and operating budgets to understand the value of green building technologies and strategies.
- First costs may be higher in traditionally designed projects due to lack of integration.
- A green building also evaluates the environmental and social impacts and benefits.

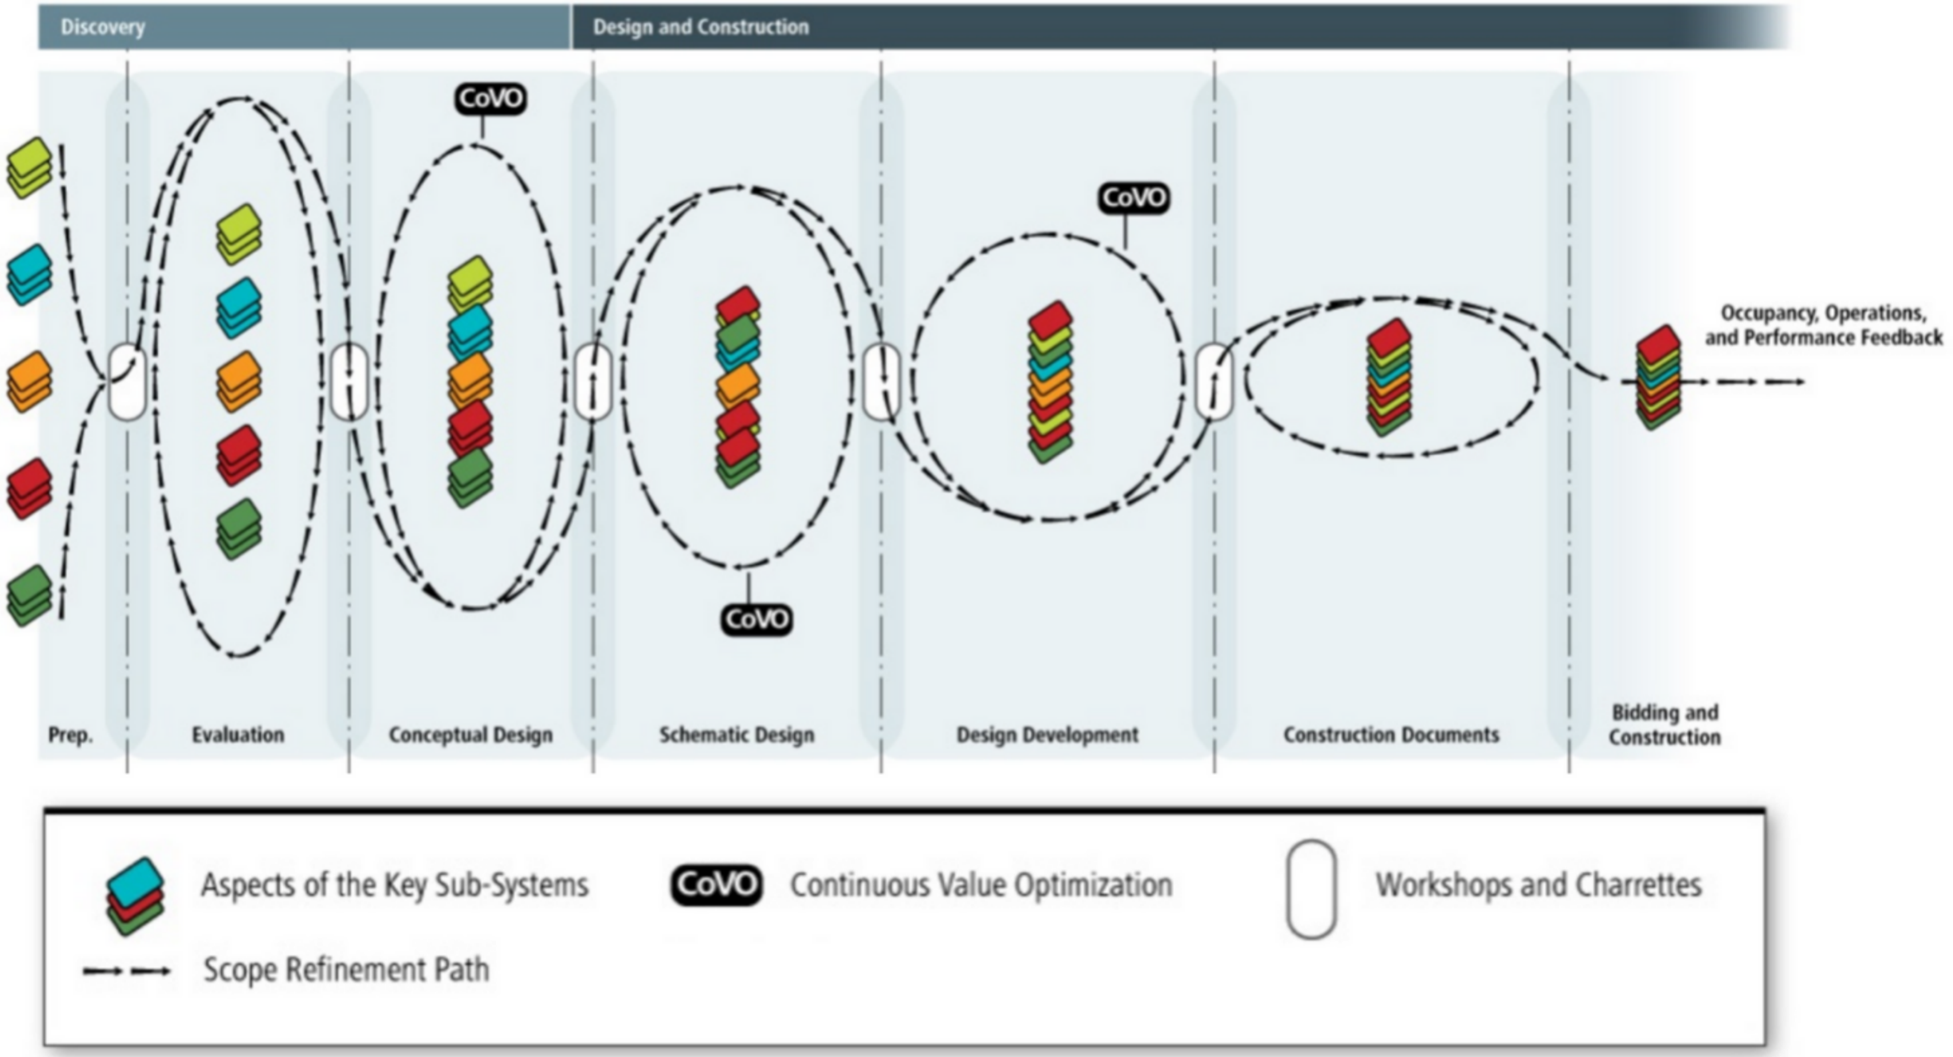

THE INTEGRATIVE APPROACH TO DESIGN AND CONSTRUCTION

BEYOND SMART CITIES

- Provides a holistic approach to understanding a project's life cycle.
- Enables design professionals to identify synergies that unify a project.
- Requires regular workshops or charrettes, research promoting positive synergies, and continuous evaluation of designed systems.
- Considers the opinions of other stakeholders, including community members.
- Encourages community involvement in architectural review proceedings.
